

CSE276C - Linear Systems of Equations

Henrik I. Christensen

Computer Science and Engineering University of California, San Diego http://cri.ucsd.edu

September 2023

Logistics

- TA hours: Andi Wednesday & Thursday (Time?)
- HW dates: Oct 17, Oct 31, Nov 14, Nov 28, Dec 7
- Release of homework on Thursday / Friday and then concurrent

Outline

- Solution Techniques Gauss Jordan
- Matrix Decomposition
- Matrix Factorization
- Singular Value Decomposition
- Rank and sensitivity

Matarial	
Material	
Numerical Pacinos: Chapter 2	

• Math for ML: Chapter 2.1-2.3

Example: Camera calibration

H. I. Christensen (UCSD)	Math for Robotics	Sep 2023	5 / 34

Example: Plane Estimation

(f)

(d)

(e)

Linear Systems of Equations

• One of the most basic tasks is solve for a set of unknowns

$$\begin{array}{rcl} a_{00}x_0 + a_{01}x_1 + a_{02}x_2 + \ldots + a_{0n-1}x_{n-1} & = & b_0 \\ a_{10}x_0 + a_{11}x_1 + a_{12}x_2 + \ldots + a_{1n-1}x_{n-1} & = & b_1 \\ \vdots & & \vdots \end{array}$$

 $a_{m-10}x_0 + a_{m-11}x_1 + a_{m-12}x_2 + \ldots + a_{m-1n-1}x_{n-1} = b_{m-1}$

H. I. Christensen (UCSD)

Math for Robotics

Sep 2023

7 / 34

Linear Systems of Equations

• One of the most basic tasks is solve for a set of unknowns $\begin{array}{rcl}
a_{00}x_{0} + a_{01}x_{1} + a_{02}x_{2} + \ldots + a_{0n-1}x_{n-1} &= b_{0} \\
a_{10}x_{0} + a_{11}x_{1} + a_{12}x_{2} + \ldots + a_{1n-1}x_{n-1} &= b_{1} \\
\vdots \\
a_{m-10}x_{0} + a_{m-11}x_{1} + a_{m-12}x_{2} + \ldots + a_{m-1n-1}x_{n-1} &= b_{m-1}
\end{array}$

• which we can rewrite

$$\mathbf{A}\vec{x} = \vec{b}$$

where

$$\mathbf{A} = \begin{pmatrix} a_{00} & a_{01} & a_{01} & \cdots & a_{0n-1} \\ a_{10} & a_{11} & a_{11} & \cdots & a_{1n-1} \\ \vdots & & & \\ a_{m-10} & a_{m-11} & a_{m-11} & \cdots & a_{m-1n-1} \end{pmatrix}, \vec{b} = \begin{pmatrix} b_0 \\ b_1 \\ b_2 \\ \vdots \\ b_{m-1} \end{pmatrix}$$

Matrix Properties

- Given an $m \times n$ matrix A we define
 - Column space Linear combination of columns
 - Row space Linear combination of row
- We can consider A a mapping:

$$\begin{array}{c} A: R^{\prime\prime\prime} \to R^{\prime\prime\prime} \\ \begin{pmatrix} x_0 \\ x_1 \\ \vdots \\ x_{n-1} \end{pmatrix} \to \begin{pmatrix} b_0 \\ b_1 \\ \vdots \\ b_{m-1} \end{pmatrix} = \mathbf{A} \begin{pmatrix} x_0 \\ x_1 \\ \vdots \\ x_{n-1} \end{pmatrix}$$

• Column space of A is vector subspace of R^m that image vectors under A

n = *dim*(*row space*) + *dim*(*null space*)

Questions

Questions

Math for Robotics

Matrix properties

H. I. Christensen (UCSD)

• Consider the square matrix A. The square matrix B is the inverse if

$$AB = I_n = BA$$

and we denote this A^{-1} .

- If the inverse exists the matrix is called regular/invertable/non-singular
- Inverse matrices are unique
- If the determinant of A: *det*(A) is zero the matrix is singular
- The transpose of A is denoted A^T and elements of the transpose are $a_{ji}^T = a_{ij}$
- useful properties

$$\begin{array}{rcrcrcr} AA^{-1} & = & I = A^{-1}A \\ (AB)^{-1} & = & B^{-1}A^{-1} \\ (A+B)^{-1} & \neq & A^{-1} + B^{-1} \\ (A^{T})^{T} & = & A \\ (A+B)^{T} & = & A^{T} + B^{T} \\ (AB)^{T} & = & B^{T}A^{T} \end{array}$$

Sep 2023

Matrix Characteristics

Can we characterize when a matrix is singular?

H. I. Christensen (UCSD)	Math for Robotics	Sep 2023	12 / 34
Singular matrices			
	. :		
• A matrix A is singular	, IIL		
• $det(A) = 0$			
• rank(A) < n			
• rows of A are not I	nearly independent		
• columns of A are n	ot linearly independent		
• the dimension of th	e null-space of A is non-zero		
• A is not invertible			

Gauss-Jordan Elimination

• How can we solve the equation system - $\mathbf{A}\vec{x} = \vec{b}$?

H. I. Christensen (UCSD)

Math for Robotics

Sep 2023 14 / 34

Gauss-Jordan Elimination

- How can we solve the equation system $\mathbf{A}\vec{x} = \vec{b}$?
- The standard form

$$\mathbf{A}\vec{x} = \vec{b} \rightarrow \mathbf{U}\vec{x}' = \vec{b}'$$

where

$$\mathbf{U} = \begin{pmatrix} d_0 & U'_m \\ & \ddots & \\ 0 & & d_{n-1} \end{pmatrix}$$

Gauss-Jordan Elimination

• How can we solve the equation system - $\mathbf{A}\vec{x} = \vec{b}$?

• The standard form

$$\mathbf{A}\vec{x} = \vec{b} \rightarrow \mathbf{U}\vec{x}' = \vec{b}'$$

where

$$\mathbf{U} = \begin{pmatrix} d_0 & U'_m \\ & \ddots & \\ 0 & & d_{n-1} \end{pmatrix}$$

- Two different approaches:
 - **1** Gauss Elimination Ux' = b'
 - **2** Gauss Jordan $Dx^* = b^*$

Allows for direct back substitution

Example of Elimination

H. I. Christensen (UCSD)

$$\begin{pmatrix} 0 & 4 & -1 \\ 1 & 1 & 1 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 5 \\ 6 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 0 & 4 & -1 & | & 5 \\ 1 & 1 & 1 & | & 6 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$

Math for Robotics

Sep 2023 14 / 34

Example of Elimination

$$\begin{pmatrix} 0 & 4 & -1 \\ 1 & 1 & 1 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 5 \\ 6 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 0 & 4 & -1 & | & 5 \\ 1 & 1 & 1 & | & 6 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 2 & -2 & 1 & | & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$

Example of Elimination

H. I. Christensen (UCSD)

$$\begin{pmatrix} 0 & 4 & -1 \\ 1 & 1 & 1 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 5 \\ 6 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 0 & 4 & -1 & | & 5 \\ 1 & 1 & 1 & | & 6 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 2 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 0 & -4 & -1 & | & -11 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ -11 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 0 & -4 & -1 & | & -11 \end{pmatrix}$$

Math for Robotics

Sep 2023 15 / 34

Example of Elimination

$$\begin{pmatrix} 0 & 4 & -1 \\ 1 & 1 & 1 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 5 \\ 6 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 0 & 4 & -1 & | & 5 \\ 1 & 1 & 1 & | & 6 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & 2 \\ 2 & -2 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ 1 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & 5 \\ 2 & -2 & 1 & | & 1 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & 5 \\ 0 & -4 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ -11 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & 5 \\ 0 & -4 & -1 & | & -11 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & -11 \end{pmatrix}$$
$$\begin{pmatrix} 1 & 1 & 1 & 1 \\ 0 & 4 & -1 \\ 0 & 0 & -2 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ -6 \end{pmatrix} \quad \begin{pmatrix} 1 & 1 & 1 & | & 6 \\ 0 & 4 & -1 & | & 5 \\ 0 & 0 & -2 & | & -6 \end{pmatrix}$$

Gauss Elimination \rightarrow Gauss Jordan

Questions

H. I. Christensen (UCSD)

Questions

Math for Robotics

Sep 2023 16 / 34

Matrix Decomposition

• Given an $m \times n$ matrix we can write **A** in the form

$\mathbf{PA} = \mathbf{LDU}$

• where:

- P is an $m \times m$ permutation matrix that specs row interchanges
- *L* is a lower triangular matrix with 1 along the diagonal
- U is a upper triangular matrix with 1 along the diagonal
- *D* is a square diagonal only matrix
- If **A** is a symmetric positive definite then **U** = **L**^T and *D* has strictly positive diagonal elements

Math for Robotics

Solving the matrix system

H. I. Christensen (UCSD)

• Our objective is to solve

LDUx = Pb which we can solve Ly = Pb (solve for y) $Ux = D^{-1}y$ (solve for x)

• Enable use of forward / backward substitution

Sep 2023

Square - Full Rank Matrices

• If A is a square $n \times n$ matrix with n linearly independent eigen vectors, then

$$A = SES^{-1}$$

where

- E is a diagonal matrix where elements are the eigenvalues of A
- S is a matrix where the columns are the eigenvectors of A
- Any solution is then a linear combination of basis vectors. Useful for example for sub-space methods (discussed later)

Math for Robotics

Matrix factorization based on $A^T A$

- We will look at QR and SVD decompositions in more detail
- Consider A has independent columns then we can factorize

$$A = QR$$

where Q is $m \times n$ and R is $n \times n$

- Q has the same column space as A but it is orthonormal, i.e., $Q^T Q = I$
- R is upper triangular

H. I. Christensen (UCSD)

- Two possible approaches:
 - Use Gram Schmidt to orthogonalize A. The columns are now an orthonormal basis, R is computed by keep track of the G-S operations. R expresses the linear combinations of Q to form A.
 - i) Form $A^T A$, ii) compute LDU factorization, iii) $R = D^{\frac{1}{2}}L^T$ and $Q = AR^{-1}$
- More efficient QR factorizations exist (see Numerical Recipes) in general $O(n^3)$

Sep 2023

Gram-Schmidt?

- Build an orthonormal basis by re-projection
- Build a basis using $proj_u(v) = \frac{\langle v, u \rangle}{\langle u, u \rangle} u$, i.e., project v onto u
- Process is then

•
$$u_1 = v_1$$

• $u_2 = v_2 - proj_{v_1}(v_2)$

•
$$u_3 = v_3 - proj_{v_1}(v_3) - proj_{v_2}(v_3)$$

•
$$u_k = v_k - \sum_{j=1}^{k-1} proj_{u_j}(v_k)$$

• $e_i = \frac{v_i}{||v_i||}$ as the normal basis vectors

Applications

H. I. Christensen (UCSD)

• QR: is an iterative process of building a factorization / eigenvectors

Math for Robotics

• If we wish to solve a system Ax = b in the LSQ sense

$$\bar{x} = (A^T A)^{-1} A^T b$$

given full rank $Q^T Q = I$ i.e. with a QR factorization

$$\bar{x} = R^{-1}Q^Tb$$

compute $Q^T R$ and back substitute for $R\bar{x} = Q^T b$ more stable than $A^T A \bar{x} = A^T b$, i.e., the Moore-Penrose pseudo inverse

Sep 2023

Questions

Questions

Math for Robotics

Singular Value Decomposition

• We can factorize any $m \times n$ matrix A as

$$A = UDV^T$$

where

H. I. Christensen (UCSD)

- U is an $m \times m$ w. columns are the eigenvectors of $A^T A$
- D is a diagonal matrix

$$D = \left(egin{array}{ccccc} \sigma_1 & & & & \ & \ddots & & 0 & \ & & \sigma_k & & \ & 0 & & 0 & \ & & & 0 & \end{array}
ight)$$

where $\sigma_1 > \cdots > \sigma_k > 0$ and the rank(A) = k

- σ_i are sqrt of eigenvalues of $A^T A$ and called the singular values
- if A is symmetric and positive definite then $U = V^T$ and D is the eigenvalue matrix of A

Sep 2023

You are telling us all this why?

- If A is under-constrained the full solution set
- $\bullet~$ If A is over-constrained the LSQ solution

Considerations

Gauss Elimination is efficient, but not necessarily stable

(1	0	0 \	(1.01	1.00	1.00	
	0	1	0		1.00	1.01	1.00	
	0	0	1 /		1.00	1.00	1.01	Ϊ
Independent			,	Independent?				

not well suited for close to singular or over-constrained systemsCan we do elimination and solve

$$Ly = b$$
 and $Ux = D^{-1}y$

if A is close to singular D^{-1} could be a challenge

Eigenvector factorization

H. I. Christensen (UCSD)

• Remembers we can factorize a square matrix

$$A = SES^{-1}$$

Math for Robotics

where E is the eigenvalue matrix and S is the eigenvector matrix

- We can add this to the trick of working with $A^T A$ or $A A^T$
- We can use

$$A^T A = V D V^T$$

and

$$AA^T = UD'U^T$$

- Where D is the eigenvalue of $A^T A$, V are the eigenvalue of $A^T A$, D' are the eigenvalue of AA^T and U are eigenvectors of AA^T
- We can decompose

$$A = UDV^T$$

- Note:
 - rank(A) = rank(D) = k
 - colspace(A) = first k columns of U
 - nullspace(A) = first n-k columns of V

Sep 2023

Numerical considerations

• If SVD generates \approx 0 eigenvalues the best is zero them out (compare values, see later)

• Example we had before

	1.01 1.00 1.00	1.00 1.01 1.00	1.00 1.00 1.01
the D matrix is then	3.01 0 0	0 0.01 0	$\left(\begin{array}{c}0\\0\\0.01\end{array}\right)$

so you barely have full rank.

 H.1. Christensen (UCSD)
 Math for Robotics
 Sep 202
 30/34

 Sensivity
 If we use
 $A = UDV^T$ then using $\sum_{i=1}^n \sigma_i u_i v_j$ solving for Ax = b is then

 $x = A^{-1}b = (UDV^T)^{-1}v \Rightarrow \sum \frac{u_ib}{\sigma_i}v_j$

as σ_i decreases we have a sensitivity problem

• The condition number is a good indicator

$$K(A) = \frac{\sigma_1}{\sigma_k}$$

Using SVD

• To solve Ax = b we can compute

$$\bar{x} = V \frac{1}{D} U^T b$$

• The solution is

- If A is non-singular then \bar{x} is the unique solution
- If A is singular then x̄ is the solution is closest to origin when b is range
 I.e., Ax̄ = b
- If A is singular and b is not in range then x̄ is the LSQ solution
 I.e., Ax̄ ≠ b
- You can use SVD for all your needs to solve the equations Ax = b

H. I. Christensen (UCSD)

Math for Robotics

Sep 2023

32 / 34

Linear Systems of Equations

- Many problems in robotics can be solved using linear systems of equations
- Stability and sensitivity are key to consider
- Numerous factorization methods available QR and SVD merely two of them
- You can use numerous tricks to make problems tractable
- Factorization part of all the big packages NumPy, Matlab, Linpack, ...
